

Catheter Test Equipment Specification

Interventional catheter testing is carried out on the IDTE 2000, hydrodynamic test bed for navigational systems. This equipment is designed for testing to ASTM F2394 - 07 *Standard Guide for Measuring Securement of Balloon Expandable Vascular Stent Mounted on Delivery System*, ISO Standard 25539-1:2003 *Cardiovascular Implants - Endovascular Devices* and ISO/TS 15539:2000 *Cardiovascular Implants - Endovascular Prostheses*.

Test Equipment Specifications

- Adjustable test track 2D and 3D, temperature maintained $\pm 2^{\circ}\text{C}$
- Adjustable flow control through test catheter
- Low friction, bidirectional stepper motor system, max speed 600cm min^{-1}
- High resolution encoders
- Integrated video capture
- Incremental and continuous rotational torque testing
- Can be combined with fatigue/durability testing and stent testing services

Test Parameters

Guidewire Movement	Flexibility
Insertion Force	Push Efficiency
Rotational Response	Torque to Failure
Track Force Measurement	Withdrawal Force Measurement
Torquability	

Typical Products Tested

Abdominal Aortic Aneurysm Grafts	Ablation Products
Annuloplasty Rings	Bifurcation Supports
Cardiac Defect Occluders	Distal Protection Devices
Endoscopic Devices	Guidewires, all sizes and functions
Heart Valves, stented and unstented	Neurological Products
Pacemaker Delivery Systems	Stents, all materials and coatings
PCTA Balloons and Delivery Systems	Thrombectomy Devices
Vascular Grafts	Vena Cava Filters
